

SALES EXECUTIVE REPORT

Executive Sales and Operating Performance Review

Frontera Comalapa, Chiapas · January 2025 – October 2026

A business in full transition

Almost everything the 2026 data shows is a consequence of four recent changes.

Nov 2025	The six-block market one block away is removed. From December onward, it stops bringing people into the area.
Jan 2026	The restaurant moves half a block to a larger location, now in front of the central park and next to the main church.
Jan 2026	Alongside the move, food and drink prices go up slightly.
2026	The larger space enables an event room and a beverage/ice-cream sublease as new revenue lines.

The verdict

\$1.86 M

Food revenue · 2025

+4.6%

Revenue, Jan-Sep 2026
vs. same period 2025

-6.9%

Tickets, same period

+12.4%

Average ticket, same
period

Revenue grows through ticket price, not more visits. That is a more moderate result than the owner's own estimate (-10/-20% tickets, up to +35% average ticket), in the same direction but less pronounced.

Growing or shrinking? Neither

Same window (Jan 1 – Sep 30), compared year over year.

Twenty-two months: a steady line

A solid, predictable business. October 2026 is partial (6 days).

When does revenue come in?

Four three- to four-hour blocks, covering the full day from opening to close.

Lunch (14h to 17h) is the strongest block, at 30.7% of revenue. Breakfast follows closely at 25.4%, and dinner now carries 21.4%, more than the roughly 18% it made up at the old location. The single busiest hour of the day is 1pm.

Sunday carries the business

Saturday is now barely different from a weekday. Sunday sells 40% or more above the average weekday. It is the strong day, not "the weekend" in general, and that lines up with being next to the church. The lowest-revenue day is Tuesday, with Wednesday close behind.

Are low months about the rain?

Total monthly rain against revenue per day, January 2025 through September 2026.

There is no clear relationship. The correlation between monthly rain and revenue per day is only 0.23, weak and in the opposite direction from what the theory would predict. February, one of the lowest months in the whole period, is also one of the driest, and July, one of the rainiest, is one of the strongest. The low months line up with the post-holiday lull and the loss of the nearby market, not with rain.

Does rain shift the channel too?

Checked separately from the ticket-size effect already shown.

46.7%

Takeout share of
tickets, rainy hours

45.2%

Takeout share of
tickets, dry hours

The channel mix doesn't shift, a negligible 1.5-point difference. People don't switch from the table to the counter when it rains, even though the ticket itself does run a bit lower, as already shown.

Value concentrates at the table

Dine-in carries 61% of revenue on 54% of tickets. Its average ticket (\$317) keeps climbing; takeout stays flat at \$238.

What takeout customers actually order

Takeout follows almost the same hourly pattern as the rest of the business, peaking at 2 and 3pm with no separate rush of its own. Burgers are the second biggest category by volume, right behind mixed-grill platters, and the top three products alone already cover 30% of everything sold through this channel.

A combo worth testing

An idea grounded in what the data actually shows, not a guess.

A burger, drink and dessert bundle at a fixed price fits well, since that is exactly where individual takeout orders concentrate. There is no delivery service in the data, so a "free shipping" promotion doesn't fit here. A free add-on (a drink or dessert) above a minimum purchase would make more sense for counter pickup. Either idea needs to be checked against the real margin on each dish first, which this analysis doesn't calculate.

What actually sells

Stuffed chicken milanesa and the mixed-grill platter are the best sellers across the full period. Strawberry limeade and American coffee are climbing fastest; the mixed-grill platter and the Hawaiian burger are falling, comparing the same number of months each year.

A real preference: chicken over pork

Classifying each dish by the protein named in it.

Chicken outsells pork almost 16 to 1, too large a gap to be chance and more likely a matter of habit or taste. Chicken vs. beef is closer, but it flipped: beef led in 2025 (47% vs. 41%), chicken leads in 2026 (47.5% vs. 41%). Worth testing a well-built pork dish before assuming it doesn't sell, because with so few pork options on the menu, it's hard to tell customer taste from limited choice.

Regulars, but an incomplete picture

The POS only records a customer name on 22.7% of takeout tickets, and never on dine-in tickets (0%). It isn't that dine-in has no regulars, it's that the system simply never captures them there.

43

frequent customers
identified (all takeout)

~13

average orders, over 93
weeks

- Try a stamp card for takeout, where it can actually be measured.
- Start recording the dine-in customer too, even informally.

Tables are usually one or two people

Estimated from the dishes ordered on each dine-in sale, not a direct headcount.

On Sundays, family-tagged sales (kids'-menu item present) rise from 4.7% to 7.2%, more than double. The church next door seems to bring in more families that day.

Tipping is down

53% of dine-in sales record a tip. The average across all dine-in sales (same Jan-Sep window) fell from 6.61% to 4.97%, a signal to watch rather than a closed conclusion. It may reflect service attention, wait times, or how many tables each server now covers in the bigger room.

The ticket drops when it rains

Controlling for hour, month and year, the average ticket is associated with a drop of about 12% in rainy hours. Partial support for the idea that some customers duck in for shelter: the ticket doesn't fall all the way to a single-drink price, but it is lower than expected. Strong heat shows no comparable pattern.

The bet on the new location

~\$252k

Annual rent · ~14% of
sales

\$24k

Beverage/ice-cream
sublease, per year

~5

Events in the room,
Feb-Jun 2026

The larger space costs more. It only pays off if it sells more at the table, at night, and through the event room, the piece with the most potential and still underused.

Diagnosis

Strengths

- Proven resilience: absorbed the relocation
- Pricing power: ticket rose and was accepted
- Dine-in delivers more value per sale (\$317)
- Strong breakfast and Sunday base
- New location: park + church

To monitor

- Traffic down 6.9%, same window
- Tip rate fell in dine-in
- Takeout: high volume, low ticket
- Dine-in customers go unrecorded
- Saturday no longer strong on its own

Risk

- Price has a ceiling
- If the event room stays unused and traffic doesn't recover, rent will squeeze margin
- Without dine-in records, frequent customers there can't be measured or rewarded

Recommendations

- 1 Develop the event room as a formal revenue line.**

Because: rent is ~14% of sales, and the room is the piece that justifies the larger location.

- 2 Build a Sunday family package.**

Because: family-tagged sales go from 4.7% to 7.2% of dine-in sales that day.

- 3 Keep a fast, solo-breakfast option.**

Because: an estimated 41% of dine-in sales are a single person.

- 4 Recover traffic, not raise prices again.**

Because: the ticket already rose 12.4%, and that path has a ceiling.

- 5 Try a stamp card for takeout.**

Because: that is where frequent customers (43) can actually be identified and measured.

- 6 Review service and staffing in the dining room.**

Because: the average tip fell from 6.61% to 4.97% in the same window.

- 7 Raise the takeout ticket with a simple suggested combo.**

Because: it stays flat at \$238, far from dine-in's \$317.

- 8 Plan staffing and inventory around the real season, not the calendar.**

Because: July-August and December remain the clear yearly peaks.

IN ONE LINE

The average ticket grew and evenings gained revenue share; the challenge now is recovering visits, protecting service quality, and filling Sunday, the event room, and the slow hours.
