

Executive Sales and Operating Performance Review, 2025–2026.

This report reviews sales performance before and after a period of operational change: loss of nearby foot traffic, relocation to a larger storefront, and a price adjustment. The objective is to assess revenue stability, average ticket behavior, traffic recovery, and the economic implications of the new premises.

2025 FOOD SALES

7,344 tickets · \$5,097/day

AVERAGE TICKET (2026)

EXECUTIVE SUMMARY

REVENUE PRESERVED

Same January–June window: **+1.4%** in revenue, with **-4.8% fewer tickets**. After losing the nearby market, keeping revenue broadly flat is a positive result, not a warning sign.

PRICE, NOT VOLUME

The average ticket increased **+6.5%** (following the January 2026 price adjustment), above 3.69% inflation. Customers absorbed the increase without a revenue decline, showing **solid pricing power**.

BREAKFAST AND LUNCH

The peak is **14–15h** y el **breakfast (8–11h) is the #1 time block** (29% of revenue). After 18h, activity drops sharply (18%).

WEEKEND AND CHURCH TRAFFIC

Saturday and Sunday generate **+41%** above the weakest weekdays. Sunday morning is strong, consistent with being **next to the main church**.

THE NEW LOCATION

The larger space raises rent to **~14% of sales**. New revenue lines such as the event room and the beverage/ice-cream sublease need to justify that move.

Overall sales performance

The revenue comparison shows a stable operation during a transition period. The restaurant preserved sales despite lower foot traffic, which suggests commercial resilience; however, future growth will depend on recovering volume and making better use of the new location.

Context behind the 2026 numbers

In November 2025, the six-block market located one block away from the restaurant was removed; from December onward, it stopped bringing people into the area. In January 2026, the business moved half a block to a larger location in front of the central park and next to the main church, while also applying a moderate price increase. Most of what the 2026 data shows is a consequence of these three changes.

2026 vs. 2025 — same period (Jan 1 – Jun 15)

Year-over-year percentage change. Revenue is flat, supported by price rather than traffic

Year-over-year comparison using the same window (Jan 1 – Jun 15) for comparability.

Comparing the same period across both years, revenue increased **+1.4%**, practically flat. Two forces sit underneath this result: the restaurant served **-4.8% fewer tickets** (the market removal reduced foot traffic), but this was offset because **each ticket was 6.5% higher**. Seen this way, **the business protected its revenue despite losing one of its largest traffic generators**, a positive result.

Important nuance: real vs. nominal revenue

Mexico's general inflation rate in 2025 was 3.69%, and food away from home ran even higher. The +6.5% increase in average ticket is **mostly a price adjustment, not higher consumption per customer**. The positive signal is that the increase was accepted; the risk to monitor is that future growth cannot rely only on continued price increases.

Monthly trend: 17 months of operation

Monthly trend: 17 months of operation

Green bars = average revenue per operating day · partial June 2026 in amber · black line = average ticket

17 continuous months. June 2026 is shown in amber because the month is incomplete (through day 15).

Across the full series, the revenue-per-day trend is **flat** (temporal correlation $r=0.13$): a **stable and predictable business** with no signs of accelerated deterioration, although it has not yet found a growth ramp in the new location. Seasonality is clear: **July–August and December** are the peaks (July 2025 reached \$6,897/day), while **February and November** are the troughs (\$3,419/day).

When do customers arrive?

Knowing when revenue comes in makes it possible to decide where to allocate staff, promotions, and operational effort. The pattern is clear and fits the new location.

When does revenue come in?

Average revenue by day and hour · Green: breakfast · Amber: lunch and operating peak · Blue-gray: afternoon · Gray: closing

Average revenue by hour of day (2025), colored by operating time block.

This is a **breakfast-and-lunch business**. It starts at 8h, rises steadily, and reaches its **peak at 14–15h**. El **breakfast (8–11h) is the largest time block**: 29% of revenue and 32% of tickets. After 18h, the location is nearly empty: the entire evening contributes only 18% of revenue. However, the few customers who arrive at night spend more. The 19h average ticket is **\$378**, the highest of the day.

Saturday and Sunday carry the business

Average revenue by weekday · Weekend days (amber) outperform weaker weekdays by ~40%

Average revenue by weekday (2025).

The weekend carries the business. Saturday (\$6,559/day) and Sunday generate **+41%** above weekdays, with higher tickets (\$302 on Saturday vs. ~\$233 on weekdays). The weakest days are **Tuesday and Thursday** (\$4,135/day). It is worth noting that the removed market mainly filled weekday market days, while weekend demand comes from the park and the church. That is the strength currently supporting the location, and the new address builds on it.

Heatmap: where demand concentrates

Average tickets by hour and day (2025) · Strongest periods: weekend 14–15h and Sunday mornings

Average tickets by hour - day combination. Darker cells indicate higher demand.

The strongest demand pockets are **weekend lunch hours (14–15h)** and **Sunday mornings** (post-mass breakfast). These are the time blocks to protect, and now that the restaurant is next to the church, they also offer the highest growth potential.

How much do customers spend?

Ticket size and distribution show where revenue is concentrated and where there is room to increase it.

Most tickets are small

Ticket distribution ≤\$1000 (2025) · Mean exceeds median because a few large tickets lift it

2025 ticket distribution, capped at \$1000 to show the shape.

Most tickets are **small**: the median is \$190. The mean (\$253) is higher because a few large tickets lift it. In fact, tickets of **\$1000 or more represent only 1.8% of sales, but contribute 13% of revenue**, probably group orders. With an event room now available, that high-value segment can shift from occasional to deliberate.

Dine-in vs. takeout: value concentrates in dine-in

Dine-in average ticket increased to \$294 (2026) · counter/takeout remains flat at ~\$229

Dine-in average ticket increased to \$263 (2025), counter/takeout remains flat at \$229

Dine-in vs. takeout, 2025 vs. 2026.

Service is split almost half and half, but it is evolving differently. The **dine-in channel** has the highest average ticket and **grew to \$294** in 2026. The **counter/takeout channel** gained share in number of tickets (now 48%), but its average ticket remains **flat and low, at ~\$229**. Dine-in customers are increasingly valuable; takeout contributes volume but leaves less value per order. This creates a clear opportunity for add-on sales.

Implications of the new location

The relocation changed the cost structure and opened potential new revenue sources. The assessment of the new space should consider both rent pressure and the ability to generate complementary revenue.

Premises rent

per year (~\$20–22k/month). Equivalent to **~14% of food sales**.

Sublease (beverages/ice cream)

per year (\$2k/month). Covers **~10% of rent** without operational effort.

Event room

Untapped

New revenue with **potentially high margin**, independent of daily foot traffic. Currently pending measurement.

This is the most delicate aspect of the assessment. A common restaurant rule of thumb is that rent should not exceed **~6–10% of sales**; here it is around **14–15%**. This is not alarming, but it does make clear that **the larger location is justified only if it generates revenue the old location could not**: namely, the event room and the sublease. The sublease is already contributing; the event room is the piece with the highest potential and should be activated and measured as soon as possible. *(This is an informational analysis of the rent-to-sales relationship, not financial advice; input and labor costs would be needed for a full margin analysis.)*

Diagnosis

Putting everything together: a healthy base that withstood a difficult transition, with items to monitor and a clear risk if no action is taken.

■ STRENGTHS

- **Proven resilience:** revenue was maintained despite losing the nearby market and relocating.
- **Pricing power:** average ticket increased +6.5% and customers accepted it.
- Solid base of **breakfast y strong weekends** (+41%).
- Privileged new location: **central park + main church**.
- El **dine-in ticket is growing** (\$294): willingness to spend.

■ TO MONITOR

- **Lower traffic** after the market was removed (~5% fewer customers).
- **Rent at ~14% of sales**, above the healthy range: the new location carries more weight.
- **Weak weekdays** (Tuesday and Thursday) con capacidad ociosa.
- **Counter/takeout:** high volume, low and flat average ticket.

■ RISK IF NO ACTION IS TAKEN

- Growth cannot continue coming only from price: that path has a ceiling. **If the event room is not developed and new -location traffic is not built, the higher rent will pressure margins.** The priority is no longer to charge more, but to **fill the new space**: through events, park and church traffic, and weekday frequency recovery.

Recommendations

Seven prioritized actions, each tied to a specific finding and ordered from higher to lower expected impact.

Develop the event room as a formal revenue line

This is the new revenue source with the highest potential and margin: it does not depend on daily foot traffic and uses space that is already being paid for. Create a **rental package + group menu**, promote it with the church and municipality (baptisms, first communions, meetings, holiday gatherings), and **track its revenue separately** from the first month.

Because: rent is **~14% of sales** and the event room is the piece that justifies the larger location

Capitalize on the location: park + church

Estar frente al parque central y next to the main church es un activo enorme. El **post-mass Sunday** is already strong: reinforce it with a clear Sunday breakfast offer, visibility at the entrance, and presence in church and park events.

Because: **Sunday mornings** are among the hottest time blocks in the heatmap

Recover traffic, not raise prices further

The average ticket already increased and was accepted; insisting on that path has a ceiling. The market that used to bring foot traffic is gone, so the priority is to **build the restaurant's own customer base** in the new location: loyalty mechanisms (stamp card), reactivation of frequent customers, and a reason to return during the week.

Because: **tickets -4.8%** while **average ticket +6.5%**. Volume is the pending lever

Protect and grow breakfast

It is the #1 time block for the business. Protecting it is the most profitable move: **breakfast combos**, a clear "breakfast of the day", and morning loyalty incentives for recurring customers.

Because: **breakfast (8-11h) = 29% of revenue**

Activate Tuesday and Thursday

The weekend is already strong; the margin opportunity is **during weekdays**, where the loss of the market was felt the most. A Tuesday/Thursday promotion uses idle capacity without cannibalizing strong days.

Because: **Thursday generates \$4,135/day vs. Saturday \$6,559/day**

Increase the takeout average ticket

Counter/takeout is high volume (48% of tickets) but low and flat in average ticket. It is the clearest upsell opportunity: **drink, dessert, or combo** suggested with each order. Small increases matter because of the volume.

Because: counter/takeout ticket **flat at ~\$229** vs. dine-in **\$294**

Plan by season

July–August and December are the peaks; **February and November** are the troughs. Adjusting inventory, staffing, and cash flow to this calendar helps avoid shortages during peaks and idle costs during troughs.

Because: July reached **\$6,897/day** vs. February **\$3,419/day**

METHODOLOGICAL NOTE

Source: point-of-sale exports (VENTAS_2025.xls and VENTAS_ANUAL_2026.xls). Period: Jan 1, 2025 – Jun 15, 2026.

Cleaning: from 8,127 and 3,120 raw records, **7,344** (2025) and **2,888** (2026) completed sales were analyzed. Deleted, open, and \$0 tickets were excluded (voided tickets without payment method).

Criteria: the *Creation* ticket timestamp was used as the time reference (more reliable than closing time, which can be affected by batch administrative closures). The year-over-year comparison uses the same window (Jan 1 – Jun 15).

Notes: currency is Mexican pesos (MXN). Mexico general inflation 2025: 3.69% (INEGI). Rent and sublease figures were provided by the business; the event room is not yet measured.
